

1. (Currently amended) A piston for a suction valve, comprising:  
a head for engaging said a top surface of said suction valve seat and a stem  
extending downwardly from said head through said suction valve seat, said stem  
having a first transverse aperture and a second transverse aperture; said second  
aperture opens to said first aperture, both said first and second aperture are at a lower  
portion of said stem, said first aperature at a right angle to said second aperture.
